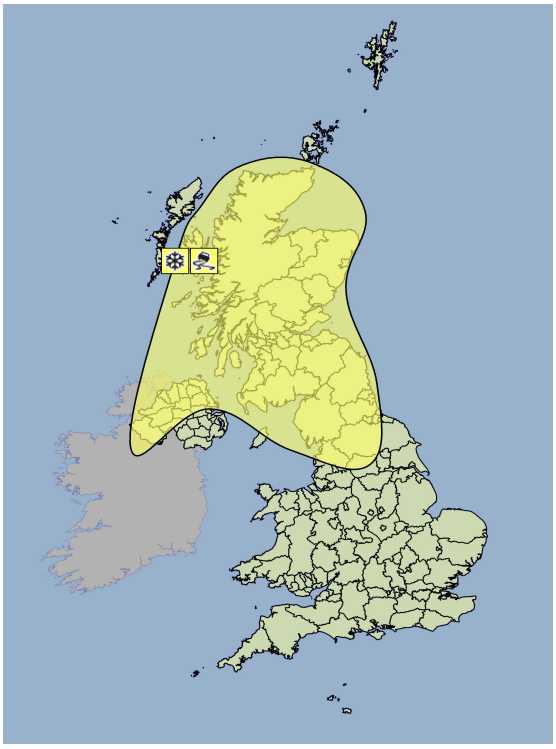
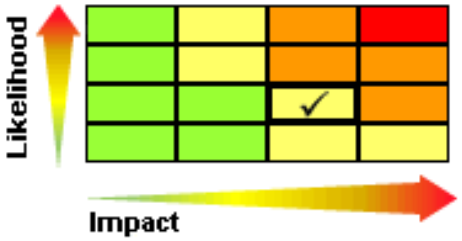
National Severe Weather Warning Service





Chief Forecasters Assessment
The cold, unstable airmass across Scotland and Northern Ireland will extend further south during Tuesday with snow falling to progressively lower levels across northern England. On Tuesday night a more organised area of showery precipitation is likely to affect Scotland, which has the potential to produce several centimetres of snow at low levels, including the Central Belt - see separate amber warning. This area of snow may also affect parts of northern England. Ice is also likely to be a hazard again on Tuesday night.

This warning will be kept under review and updated as and when necessary.

The Met Office have issued a **Yellow Warning** of **Snow and Ice**

Valid from **12:30 on Tue, 13th Jan 2015** until **12:00 on Wed, 14th Jan 2015**

Frequent showers of sleet and snow will affect Scotland and Northern Ireland through Tuesday. Further accumulations of 2-5 cm of snow are likely above about 100 m, but also to low levels locally, and more widely over the northern half of Scotland, where a further 10 cm or more is likely above 300 m. Icy patches are likely to develop from early this evening. Hail and lightning will be additional hazards, especially close to western coasts.

Later on Tuesday the risk of snow extends into northern England, especially across the Pennines and higher parts of Cumbria. Meanwhile, a more persistent spell of snow may settle at low levels across Scotland on Tuesday night and into Wednesday morning - see separate amber warning.

The public should be aware of the risk of disruption to transport.

This is an update to extent the yellow area further south across northern England and also to change the position in the risk matrix to allow for a low risk of some medium impacts.
